

Binocular camera depth algorithm example

Binocular camera depth algorithm example

1. Use of binocular depth estimation algorithm

- 1.1. Start with RDK X5 official binocular camera
 - Function installation and update

Expected results

1.2. Offline local image re-injection

- 1.3. In addition, you can start the node through the component method

2. Interface description

Parameter

3. Notes

The stereo depth estimation algorithm is a StereoNet model trained on the SceneFlow dataset using the horizon [OpenExplorer].

The algorithm input is the stereo image data, which are the left and right views. The algorithm output is the depth of the left view.

This example uses the mipi stereo camera as the image data input source, uses the BPU for algorithm reasoning, publishes a topic message containing the left image of the stereo image and the perception result, and renders the algorithm result on the PC rviz2.

1. Use of binocular depth estimation algorithm

1.1. Start with RDK X5 official binocular camera

- Connect power
- Connect the binocular mipi camera to RDK X5, note that the blue side is facing the HDMI port. Do not connect the wires in reverse, which will cause the left and right images to be swapped and the binocular algorithm to run incorrectly

- Connect the development board and the display via an HDMI cable
- Log in to RDK X5 via MobaXterm or other ssh tools (please log in as the root user. Root login username: root password: root)

Function installation and update

- Before running the binocular depth algorithm, you need to ensure that the `tros-humble-mipi-cam` function package is above version 2.3.6 and the `tros-humble-hobot-stereonet` function package is above version 2.3.3.

The command to query the function package version is as follows.

```
apt list | grep tros-humble-mipi-cam
```

```
root@ubuntu:~# apt list | grep tros-humble-mipi-cam
WARNING: apt does not have a stable CLI interface. Use with caution in scripts.
tros-humble-mipi-cam/unknown,now 2.3.6-jammy.20250109.065921 arm64 [installed]
root@ubuntu:~#
```

```
apt list | grep tros-humble-hobot-stereonet
```

```
root@ubuntu:~# apt list | grep tros-humble-hobot-stereonet
WARNING: apt does not have a stable CLI interface. Use with caution in scripts.
tros-humble-hobot-stereonet-render/unknown 2.0.1-jammy.20240816.143408 arm64
tros-humble-hobot-stereonet-utils/unknown,now 2.3.1-jammy.20241225.024524 arm64 [installed,automatic]
tros-humble-hobot-stereonet/unknown,now 2.3.3-jammy.20250219.033718 arm64 [installed]
root@ubuntu:~#
```

- If the version does not meet the requirements, you need to update it. Run the following command in the terminal of the RDK system to update it.

```
apt update
```

```
apt upgrade
```

- **Note:** In some old image versions, there may be a `tros-humble-stereonet-model` function package. You need to uninstall it before you can update the function package. Run the following command in the terminal of the RDK system:

Confirm that the system has the tros-humble-stereonet-model function package

```
apt list | grep tros-humble-hobot-stereonet-model
```

Uninstall

```
sudo apt-get remove tros-humble-stereonet-model
```

If the uninstallation fails, execute the forced deletion command (optional)

```
sudo dpkg --remove --force-all tros-humble-stereonet-model
```

Installing new packages

```
sudo apt install -y tros-humble-hobot-stereonet
```

- Confirm whether the camera connection is normal. Connect to RDK X5 via SSH and execute the following command. If the output is as shown in the figure, it means that the camera connection is normal.

```
i2cdetect -r -y 4
i2cdetect -r -y 6
```

```
root@ubuntu:~# i2cdetect -r -y 4
i2cdetect -r -y 6
    0  1  2  3  4  5  6  7  8  9  a  b  c  d  e  f
00:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
10:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
20:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
30: 30  --  --  --  --  --  --  --  --  --  --  --  --  --  --

70:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
    0  1  2  3  4  5  6  7  8  9  a  b  c  d  e  f
00:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
10:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
20:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
30:  --  -- 32  --  --  --  --  --  --  --  --  --  --  --  --
40:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
50: 50  --  --  --  --  --  --  -- 58  --  --  --  --  --  --
60:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
70:  --  --  --  --  --  --  --  --  --  --  --  --  --  --  --
root@ubuntu:~#
```

- Start the binocular algorithm, connect to RDK X5 via ssh, and execute the following command:

```
source /opt/tros/humble/setup.bash
```

Start the stereo model launch file, which includes the algorithm and the startup of the stereo camera node.

```
ros2 launch hobot_stereonet stereonet_model_web_visual_v2.launch.py \
need_rectify:=False mipi_image_width:=640 mipi_image_height:=352
mipi_l_pwm_enable:=True \
height_min:=-10.0 height_max:=10.0 pc_max_depth:=5.0
```

- If the user wants to save the depth estimation results, you can add the following parameters to achieve it, `save_image_all` turns on the save switch, `save_freq` controls the save frequency, and the image will be saved in the `stereonet_images` directory:

Configure tros.b humble environment

```
source /opt/tros/humble/setup.bash
```

Start the stereo model launch file, which includes the algorithm and the startup of the stereo camera node

```
ros2 launch hobot_stereonet stereonet_model_web_visual_v2.launch.py \
need_rectify:=False mipi_image_width:=640 mipi_image_height:=352
mipi_l_pwm_enable:=True \
height_min:=-10.0 height_max:=10.0 pc_max_depth:=5.0 \
save_image_all:=True save_freq:=4
```

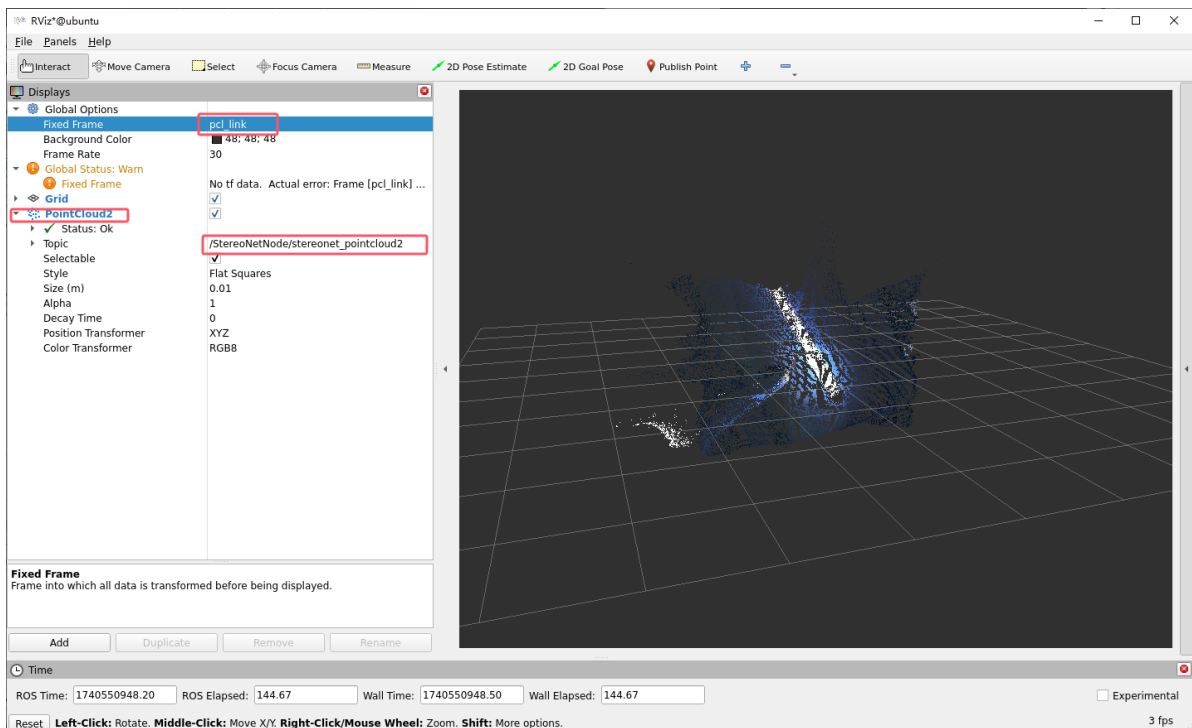

Expected results

- To view the depth map via the web page, enter <http://ip:8000> in the browser (the RDK X5 IP in the picture is 192.168.2.52).

- To view point clouds through rviz, users need to have a certain ROS2 foundation, configure PC and RDK X5 to the same network segment, be able to ping each other, and subscribe to related topics published by the binocular model node before they can display point clouds in rviz.

Note: The following configurations need to be made in rviz.

1.2. Offline local image re-injection

- If you want to use local images to evaluate the algorithm effect, you can use the following command to specify the algorithm operation mode, image data address and camera internal parameters, and ensure that the image data is dedistorted and aligned with the epipolar line. The image format is shown in the figure below. The first left-eye image is named left000000.png, the second left-eye image is named left000001.png, and so on. The corresponding first right-eye image is named right000000.png, the second right-eye image is named right000001.png, and so on. The algorithm traverses the images in sequence until all images are calculated:

- The algorithm runs offline as follows. Connect to RDK X5 via ssh and execute the following command. The results of the offline run will be saved in the `stereonet_images` directory:

Configure tros.b humble environment

```
source /opt/tros/humble/setup.bash
```

Start the binocular model launch file and pay attention to the camera parameter settings. You need to manually enter the corrected parameters.

```
ros2 launch hobot_stereonet stereonet_model_web_visual.launch.py \
need_rectify:=False use_local_image:=True local_image_path:=离线数据目录 \
stereonet_model_file_path:=/opt/tros/humble/share/hobot_stereonet/config/x5basep
lus_alldata_woIsaac.bin postprocess:=v2 \
camera_fx:=505.044342 camera_fy:=505.044342 camera_cx:=605.167053
camera_cy:=378.247009 base_line:=0.069046 \
height_min:=-10.0 height_max:=10.0 pc_max_depth:=5.0 save_image_all:=True
```

The parameters have the following meanings.

Name	Parameter Value	Explanation
use_local_image	Default False	Whether to enable image reload mode
local_image_path	-	The directory where the image is reloaded
camera_fx	-	Camera internal parameters
camera_fy	-	Camera internal parameters
camera_cx	-	Camera internal parameters
camera_cy	-	Camera internal parameters
base_line	-	Baseline distance

- After the algorithm runs successfully, you can also display the real-time rendering data through the web page and rviz, refer to the above

1.3. In addition, you can start the node through the component method

Configure tros.b humble environment

```
source /opt/tros/humble/setup.bash
```

Terminal 1 starts the binocular model launch file

```
ros2 launch hobot_stereonet stereonet_model_component.launch.py \
stereo_image_topic:=/image_combine_raw stereo_combine_mode:=1 need_rectify:=True \
height_min:=0.1 height_max:=1.0 KMean:=10 stdv:=0.01 leaf_size:=0.05
```

Terminal 2 starts the launch file of the mipi binocular camera

```
ros2 launch mipi_cam mipi_cam_dual_channel.launch.py \
mipi_image_width:=1280 mipi_image_height:=640
```

2. Interface description

Subscribe to topic

Name	Message Type	Explanation
/image_combine_raw	sensor_msgs::msg::Image	The topic of left and right eye spliced images published by the binocular camera node is used for model reasoning depth

Post a topic

Name	Message Type	Explanation
/StereoNetNode/stereonet_pointcloud2	sensor_msgs::msg::PointCloud2	Published Point Cloud Depth Topics
/StereoNetNode/stereonet_depth	sensor_msgs::msg::Image	The published depth image, the pixel value is the depth, the unit is millimeter
/StereoNetNode/stereonet_visual	sensor_msgs::msg::Image	A relatively intuitive visual rendering image published

Parameter

Name	Parameter Value	Explanation
stereo_image_topic	Default /image_combine_raw	Subscribe to the topic name of the binocular image message
need_rectify	Default True	Whether to perform baseline alignment and dedistortion on the stereo data. The camera internal and external parameters are specified in the config/stereo.yaml file.
stereo_combine_mode	Default 1	The left and right images are often spliced together on one image before being published. 1 means top-bottom splicing, 0 means left-right splicing, indicating how the binocular algorithm splits the image
height_min	Default -0.2	Filter out points whose height in the vertical direction of the camera is less than height_min, in meters
height_max	Default 999.9	Filter out points whose height in the vertical direction of the camera is greater than height_max, in meters
KMean	Default 10	When filtering sparse outliers, count the number of neighboring points of each point and the distance between each point and the 10 nearest points around it.
stdv	Default 0.01	When filtering sparse outliers, the threshold for determining whether an outlier is present is set to 0.01.
leaf_size	Default 0.05	Set the unit density of the point cloud, indicating that there is only one point in a 3D sphere with a radius of 0.05 meters

3. Notes

1. The input size of the model is width: 1280, height 640, and the image resolution released by the camera should be 1280x640
2. If the format of the image released by the binocular camera is NV12, the stitching method of the binocular image must be up and down stitching
3. The downward direction of the camera cable is the positive direction of the camera
